Epidemiology of valvular disease in the adult. In this setting, risk scoring plays an important role, identifying high-risk patients who could benefit from a percutaneous approach. The clinical evaluation remains essential in establishing a diagnosis in patients presenting with heart failure due to valvular heart disease.

The presence of dynamic hypertrophic cardiomyopathy also requires an approach. The risk of thromboembolism and bleeding is higher during the postoperative period and requires increased awareness of the monitoring of anticoagulant therapy. In routine practice, clinicians should be aware of potential inaccuracies in flow quantification and aim to internally validate flow measurement in the aorta versus LV stroke volumes in patients without

mitral regurgitation. McCann1.Circulation;61-7.It confirms the presence of aortic stenosis; assesses the degree of valve calcification, LV function and wall thickness; detects the presence of other associated valve disease or aortic pathology and provides prognostic information. The management of mechanical prosthetic valve thrombosis is high risk, whatever the option taken.
