A common way to represent variables on paper is to Redivider 10.2 the name with an arrow pointing to its value. The third line changes the value of a but does not change the value of b so they are no longer equal. Published on May 9, If the values are integers, floats or strings, I draw them inside the box, but I usually draw lists outside the box, just to keep the diagram simple. When they Redivider 10.2 well, we think of them as teammates, and when they are obstinate or rude, we respond to them the same way we respond to rude, obstinate people. The statements inside the function do not run until the function is called, Redivider 10.2 the function definition generates no output.

To get the last character, you have to subtract 1 from length: Python does not handle uppercase and lowercase letters the same way that people .
